

GIT Hands-On 2

Description:

This hands-on lab covers the fundamentals of using **.gitignore** to manage and exclude unwanted files and folders from being tracked by your version control system.

WorkFlow

Step 1: Create Log Files and Folders

Navigate to Repository: Ensure you are inside your working directory (GitDemo):

cd GitDemo

Create Log File and Folder: Create a sample .log file and a log directory in your working directory:

touch sample.log

mkdir log

WorkFlow

Step 2: Configure and Update .gitignore

Create .gitignore File: Open and create the .gitignore file using Notepad++:

notepad++ .gitignore

Add Ignore Rules: Inside the Notepad++ window, add rules to ignore log files and folders, then save and close the file:

***.log**
log/

Step 3: Verify Status and Commit Changes

Check Status: Verify that Git correctly ignores the log files and folder:

git status

Stage and Commit: Stage the .gitignore file and commit the changes to your local repository:

git add .gitignore

git commit -m "Add gitignore file to ignore log files and folders"

Push to Remote: Push your updates to the remote repository:

git push origin master

Git Bash & Output
